May function in the response of hemopolatic cells to external signals and in maintaining endothelial survival during infection.

1. SUBCELLULAR LOCATION: Intracellular.

1. SUBCELLULAR LOCATION: Intracellular.

1. TISSUE SPECITY: Expressed in hemopoietic tissues, including bone marrow, spleen and thymus.

1. INDUCTION: By granulocyte-macrophage colony-stimulating factor and LPS in macrophages.

2. SIMILARITY: Contains 1 Bcl-2 homology 1 (BH1) domain.

2. SIMILARITY: Belongs to the Bcl-2 family.
                                                                                                 01-FEB-1995 (Rel. 31, Last sequence update)
28-FEB-2003 (Rel. 41, Last annotation update)
Bcl-2-related protein Al (BFL-1 protein) (Hemopoietic-specific early
response protein) (Al-A).

Natl. Acad. Sci. U.S.A. 100:8298-8303(2003).
-!- FUNCTION: This protein is essential for replication of the chromosome. It is also involved in DNA recombination and repair (By similarity).
-!- SIMILARITY: Contains 1 SSB domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gloeckner F.O., Kube M., Bauer M., Teeling H., Lombardot T., Ludwig W., Gade D., Beck A., Borzym K., Heitmann K., Rabus R., Schlesner H., Amann R., Reinhardt R., "Complete genome sequence of the marine planctomycete Firellula sp. strain 1.";

A comparison of three distinct ferritin complementary DNAs, the corresponding subunits, and identification of compartment. Expressed in peripheral blood, spleen, and bone marrow, at moderate levels in lung, small intestine and testis, a a minimal levels in other tissues. Also found in vascular smooth muscle cells and hematopoietic malignancies.

-- INDUCTION: By phorbol ester and inflammatory cytokines, such as TNF-alpha, or IL-1-beta, but not by growth factors.

-- SIMILARITY: Contains 1 BC-2 homology 1 (BH1) domain.

-- SIMILARITY: Belongs to the BC1-2 family. Gaps 01.AUG-1988 (Rel. 08, Created)

                                                             SIMILATILY/.
SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane
FUNCTION: Required for disulfide bond formation in some periplasmic proteins. Acts by oxidizing the dsbA protein (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oxidoreductase, Redox-active center, Transport, Electron tra

The complete genome sequence of Haemophilus ducreyi.";

Submitted (JUN-2003) to the EMBL/GenBank/DDBJ databases.

I. TUNCTION: Catalyzes a salvage reaction resulting in the formation of AMP, that is energically less costly than de novo synthesis.

C. I. CATALYTIC ACTIVITY: AMP + diphosphate = adentine + 5-phospho-alpha-

D. PAHWAY: Putine salvage.

C. I. STHUMAY: Homodimer (By similarity).

C. SUBUNIT: Homodimer (By similarity).

C. SUBURIARATY: Belongs to the purine/pyrimidine

phosphoribosyltransferase family.

                                                                                                                                                                                                                                                                         -!- FUNCTION: APPEARS TO BE THE POSITIVE ACTIVATOR OF UHPT TRANSCRIPTION.
-!- SUBCELLULAR LOCATION: CYLOPLASMIC (Probable).
-!- PTM: PHOSPHORYLATED BY UHPB (PROBABLE).
-!- SIMILARITY: COLTAINS 1 response requiatory domain.
-!- SIMILARITY: BELONGS TO THE LUXR/UHPA FAMILY OF TRANSCRIPTIONAL REGULATORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

-!- FUNCTION: RNA-editing deaminase involved in somatic hypermutation, gene conversion, and class-switch recombination. Required for several crucial steps of B-cell terminal differentiation necessary for efficient antibody responses.

-!- CATALYTIC ACTIVITY: Cytidine + H(2)O = uridine + NH(3).

-!- COFACTOR: Zinc (By similarity).

-!- COFACTOR: Zinc (By similarity).
                          "Specific expression of activation-induced cytidine deaminase (AID), a novel member of the RNA-editing deaminase family in germinal center B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SEQUENCE FROM N.A.

Biol. Reprod. 52:438-443(1995).

-I. FUNCTION: Delivers retinol from the liver stores to the peripheral tissues. In plasma, the RBP-retinol complex interacts with transchyretin, this prevents its loss by filtration through the kidney glomeruli.

-I. SUBCELDILAR LOCATION: Secreted.

-I. SUBCELDILAR LOCATION: Secreted.

PRINGE=17-199.

DISEASE: Defects in RBP4 are a cause of retinol-binding protein deficiency [MIM:180250]. This condition causes night vision problems. It produces a typical "fundus xerophthalmicus," featuring a progressed atrophy of the retinal pigment epithelium.

Protein posttranslationally and results in defective delivery and protein posttranslationally and results in defective delivery and supply of vitamin to the epidermal cells (a condition associated with a dermatosis).

SIMILARITY: Belongs to the lipocalin family.

DATABARE: NAME=Mutations of the RBP4 gene;

RT Anino acid sequence homologies between rabbit, rat, and human serum

RT Anino acid sequence homologies between rabbit, rat, and human serum

RT Treinol-binding proteins:

CC -: FUNCTION: Delivers retinol from the liver stores to the peripheral

CC -: FUNCTION: Delivers retinol from the liver stores with

CC transtyretini, this prevents its loss by filtration through the

Ridney glomeruli.

CC -: SUBCELULAR LOCATION: Secreted.

CC -: SUBCELULAR LOCATION: Secreted.

CC -: SUBLINIARITY: Belongs to the lipocalin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. Nat. Struct. Biol. 7:224-229(2000).
-I. FUNCTION: REQUIRED FOR THE EXECUTION OF THE MITOTIC CHECKPOINT WHICH MONITORS THE PROCESS OF KINETOCHORE-SPINDLE ATTACHMENT AND DELAYS THE CONST OF ANAPHASE WHEN THIS PROCESS IS NOT COMPLETE. IT INHIBITS THE ACTIVITY OF THE ANAPHASE PROMOTING COMPLETE. IT SEQUESTERING CDC20 UNTIL ALL CHROMOSOMES ARE ALIGNED AT THE METAPHASE PLATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MEDLINE-99458664; PubMed-10527948;

"The complete sequence of a cucumber mosaic virus from Ixora that is deficient in the replication of satellite RNAs.";

Gef. Cont. Virol. 76:2257-2270 (1995).

-: SIMILARITY: Belongs to the cucumoviruses/bromoviruses coat protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   IRON (HEME AXIAL LIGAND) (BY SIMILARITY).

E -> K (IN REF. 1).

A -> V (IN REF. 1).

A -> GS (IN REF. 1).

N -> H (IN REF. 1).
-i- FUNCTION: Allows the bacteria to use the host heme as an iron source. Involved in the oxidation of heme and subsequent release of iron from the heme moiety.
-i- CATALYTIC ACTIVITY: Heme + 3 AH(2) + 0(2) = biliverdin + Fe(2+) + CO + 3 A + 3 H(2)0.
-i- SIMILARITY: Belongs to the heme oxygenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

"Cloning of cDNAs encoding a cell-cycle-regulatory GTP-binding
"Cloning of cDNAs encoding a cell-cycle-regulatory GTP-binding
low-M(r) (GELM) protein, Ran/TC4, from micronucleated Tetrahymena
thermophila and amicronucleated Tetrahymena pyriformis.";
Gene 144:123-125(1994)
-!- FUNCTION: GTP-binding protein involved in nucleocytoplasmic
- FUNCTION: Required for the import of protein into the nucleus and
also for RNA export. Involved in chromatin condensation and
control of cell cycle (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-NOV-1995 (Rel. 32, Created)

Environ. Microbiol. 4:799-808(2002).
-!- FUNCTION: Catalyzes the reversible adenylation of nicotinate
monouclectide (NaNN) to nicotinic acid adenine dinucleotide
(NaAN) (By similarity).
-!- CATALYTIC ACTIVITY: ATP + nicotinate ribonucleotide = diphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nelson K.E., Weinel C., Paulsen I.T., Dodson R.J., Hilbert H., Martins dos Santos V.A.P., Fouts D.E., Gill S.R., Pop M., Holmes M., Brinkac L., Beanan M., DeBoy R.T., Daugherty S., Kolonay J., Madupu R., Nelson W., White O., Peterson J., Khouri H., Hance I., Chris Lee P., Holtzapple B., Scanlan D., Tran K., Moazzez A., Utterback T., Rizzo M., Lee K., Kosack D., Moestl D., Wedler H., Lauber J., Stjepandic D., Hoheisel J., Straetz M., Heim S., Kiewitz C., Eisen J.A., Timmis K.N., Duesterhoeft A., Tuemmler B., Fraser C.M.;

plant wol. Biol. Rep. 13:333-335 (1995).
-!- SUBUNT: Part of the 30S ribosomal subunit.
-!- SUBCELLULAR LOCATION: Chloroplast.
-!- SUBCELLULAR belongs to the S3P family of ribosomal proteins.
-!- SIMILARITY: Contains 1 KH type-2 domain.

                                "Complete grounic sequence of Corynebacterium glutamicum ATCC 13032.";
Submitted (MNY-2002) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: Methyltransferase required for the conversion of
dimethylmenaquinone (DMKH2) to menaquinone (MKH2) (By similarity).
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + demethylmenaquinol =
-s-adenosyl-L-homocysteine + menaquinol.
-!- PATHWAY: Menaquinone biosynthesis; last step.
-!- SIMILARITY: Belongs to the ubiE family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SPECIES=E.col1;
